Space Weather Forecast

Issued on Friday 1 November 2024 at 12:16 Local

This forecast provides a four-day assessment of space weather events. The probabilities stated below are for reaching or exceeding the given levels. For more information about space weather impacts please see the Met Office Space Weather Scales https://www.metoffice.gov.uk/weather/learn-about/space-weather/uk-scales

---

Space Weather Forecast Headline: Moderate to High solar activity with Moderate flares expected, and a chance of further Strong flares. S1 Minor Solar Radiation Storm slowly easing.

Analysis of Space Weather Activity over past 24 hours

Solar Activity: High following a peak Strong flare at 31/2120 UTC from the sunspot AR3878 in the northeast. There are 13 sunspot regions, consisting of 11 numbered and two unnumbered regions. AR3878 is the most significant flare source, with a complex magnetic structure. AR3869 in the southwest is the most magnetically complex region and has shown some slight enhancement in recent hours, it continues to display opposite polarity to what would be expected for a southern disc sunspot. The remaining regions are relatively stable and simpler in structure.

No clearly Earth-directed CMEs (coronal mass ejections) were observed in available imagery. No notable CME has been observed from the recent Strong flare.

Solar Wind / Geomagnetic Activity: Solar wind speeds were elevated to start, generally around 520 km/s but highly variable. Winds saw a generally decreasing trend to current slightly elevated levels of around 420km/s. The Interplanetary Magnetic Field (IMF), Bt, was predominantly weak, but saw an increase to moderate levels following a couple of weak CME arrivals. The important north-south component, Bz, initially varying weekly became more persistently and moderately negative following a weak CME arrival, before returning to weekly positive values. Geomagnetic activity was Quiet to Unsettled (Kp1-3), but with an Active (Kp4) interval between 31/2100-2359UTC.

Energetic Particles / Solar Radiation: The count rate of energetic particles (high energy protons) was at S1 Minor Radiation Storm levels throughout, but with a slowly easing trend.

Four-Day Space Weather Forecast Summary

Solar Activity: Moderate or High activity is expected to continue with occasional Moderate flares expected and a chance of further isolated Strong flares. By day 3 (3 Nov) onward flare risk perhaps reducing somewhat.

Solar Wind / Geomagnetic Activity: There are no further CME arrivals currently expected, however given the number of active sunspot regions on the disc, this may change at short notice. Mainly Quiet to Unsettled geomagnetic conditions expected with a chance of Active and a slight

chance of a G1 Minor Storm given any further CME influence. There is a slight chance of Active to G1 Minor Storms from later on day 2 (02 Nov), should connection to a faster solar wind occur, but with a greater likelihood of connection by day 3 (03 Nov).

Energetic Particles / Solar Radiation: The count rate of energetic particles (High energy protons) is expected to continue easing, thought likely to fall below the S1 Minor Radiation Storm level through day 1 (01 Nov). However, any further notable flares will bring the potential for further enhancement.

Geomagnetic Storms

Geomagnetic Storm Probability (Exceedance)	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Minor or Moderate	G1 to G2	No	10	10	20	10
Strong	G3	No	1	1	1	1
Severe	G4	No	1	1	1	1
Extreme	G5	No	1	1	1	1

Radio Blackouts - X-Ray Flares

X-Ray Flares Probability	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Active	R1-R2 (M Class)	Yes	80	80	70	70
Very Active	R3-R5 (X Class)	Yes	30	30	20	20
